

Success Story Optimal™ Sunscreen

The Technology

Flinders University researchers, in conjunction with Hamilton Laboratories, developed a new generation sunscreen that not only blocks all the known adverse effects of ultraviolet radiation in sunlight, but also protects against UV damage to the immune system. It is a known fact that UV radiation can weaken the body's immune system and can contribute to the development of some skin cancers. The newly developed Optimal™ sunscreen has a sunburn protection rating of SPF30+, with the added benefit of protection against potential UV damage to the immune system.
